Lagrange function for a hard margin SVM:

$$L(w, b, \alpha) = \frac{1}{2} \|w\|^2 - \sum_{i=1}^N \alpha_i [y_i (w^T x_i + b) - 1]$$

Partial derivations for  $w, b, \alpha$ :

$$\frac{\sigma L}{\sigma w} = w - \sum_{i=1}^N \alpha_i y_i x_i = 0$$

$$\frac{\sigma L}{\sigma b} = - \sum_{i=1}^N \alpha_i y_i = 0$$

$$\frac{\sigma L}{\sigma \alpha} = y_i (w^T x_i + b) - 1 = 0$$

Substitute  $w, b$  into the third equation:

$$y_i \left( \left( \sum_{j=1}^N \alpha_j y_j x_j \right)^T x_i + \frac{1}{N} \sum_{j=1}^N (\alpha_j y_j x_j)^T x_i \right) - 1 = 0$$

Calculate  $\alpha$  for  $x_1 = [5, 0, -5, 0]$  and  $y_1 = 1$  using:

$$\alpha_i = \frac{1}{y_i x^T x_i}$$

we get:

$$\begin{aligned} \alpha_1 &= \frac{1}{1 \times (5^2 + 0^2 + (-5)^2 + 0^2)} \\ &= \frac{1}{1 \times (25 + 0 + 25 + 0)} \\ &= \frac{1}{50} \end{aligned}$$

Similarly, we get  $\alpha_2 = \frac{1}{0}$ ,  $\alpha_3 = \frac{1}{50}$ ,  $\alpha_4 = \frac{1}{0}$ .

Hence  $\alpha^* = (0.02, \frac{1}{0}, 0.02, \frac{1}{0})$ .
